Seeking Medical Treatment

What symptoms require medical attention ?

①

Fever, fatigue and dry cough are the main symptoms of Novel Coronavirus Pneumonia (NCP). Nasal obstruction, runny nose and diarrhea may occur for a few patients. Most severe patients, on the other hand, develop dyspnea after one week, and the severe cases develop rapidly into Acute Respiratory Distress Syndrome (ARDS), septic shock, hard-to-correct metabolic acidosis, and coagulation disorder. People showing respiratory symptoms, fever, chills, fatigue, diarrhea, or conjunctival congestion should immediately seek medical treatment.

What to do if you suspect you are infected with novel coronavirus ?

②

If you suspect that you are infected with novel coronavirus, please avoid crowded places, wear a mask, keep your distance from your family, keep good ventilation, maintain personal hygiene, and seek medical treatment at the hospital nearby. Inform your doctor of your contact with others and cooperate with them in their investigation.

What to do if you suspect that others around you are infected with novel coronavirus ?

③

If you suspect that others around you are infected with novel coronavirus, please wear a mask and keep your distance from them. Also, advise them to wear a mask and seek medical treatment at the hospital nearby.
